

Customer Journey Map

Date	06 July 2026
Project Name	Credit Card Approval Prediction System
Prepared By	Joyal Kumar, Keerthi, Yasawini, Nasir, Harika

Maps the applicant's experience while using the Credit Card Approval Prediction web app, stage by stage, across actions, touchpoints, thoughts, feelings, ownership, and improvement opportunities.

Phase of Journey	Stage 1: Discovery & Eligibility Check	Stage 2: Application Form & Prediction	Stage 3: Result & Decision
Actions <i>What does the customer do?</i>	- Hears about the credit card pre-check tool from a bank webpage or friend - Opens the web app to see if they qualify before formally applying - Decides to try it instead of applying directly at the bank	- Enters personal & financial details (income, job type, family status, etc.) - Double-checks values like income and years of experience before submitting - Clicks "Predict" and waits for the result	- Views the Good/Bad Customer prediction on screen - Decides whether to proceed with a real bank application - Shares or screenshots the result, or tries again with corrected info
Touchpoint <i>What part of the service do they interact with?</i>	- Landing page (index.html) - Marketing link / referral / search result	- Web form (Flask app, /predict route) - Input fields for income, education, occupation, etc.	- Result page (result.html) - Predicted outcome message (Good/Bad Customer)
Customer Thought <i>What is the customer thinking?</i>	"Will I actually qualify before I waste time on a full bank application?" "Is this free and quick to try?"	"Am I filling this in correctly?" "Will my details be used safely?"	"Does this result mean I'll actually get approved?" "Should I apply for real now?"
Customer Feeling <i>What is the customer feeling?</i>	- Curious - Slightly unsure whether the tool is trustworthy	- Focused, a little anxious about entering financial data - Hopeful	- Relieved if approved / disappointed if not - Wants more clarity on the result
Process Ownership <i>Who is in the lead on this?</i>	- Product/Marketing (awareness) - Frontend developer (landing page)	- Backend developer (Flask app + model) - Data science team (model accuracy)	- Frontend developer (result page) - Support/product team (follow-up guidance)
Opportunities <i>How can we improve this stage?</i>	- Add a short explainer on how the prediction works and its accuracy - Add trust signals (privacy note, no data stored)	- Add inline validation and field tooltips - Show a progress indicator while the model runs	- Show a confidence score, not just Good/Bad - Suggest next steps (e.g. link to full application, tips to improve eligibility)
