

Functional & Performance Testing Template

Model Performance Test

Date	05 July 2026
Team ID	PNT2025TMID12345
Project Name	Credit Card Approval Prediction
Maximum Marks	—

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Input Validation – Applicant Details (name, gender, marital status, education, employment type)	Enter valid and invalid values (e.g., blank name, unsupported characters, missing dropdown selection) in the applicant details form	Valid inputs are accepted; clear validation errors are shown for invalid/missing fields	Valid entries accepted; blank/invalid fields correctly flagged with inline error messages	Pass
FT-02	Numeric Input Validation (annual income, age, loan amount, number of dependents, credit score)	Enter numbers within valid ranges (e.g., age 18–70, income > 0) and outside valid ranges (e.g., negative income, age 5, credit score 950)	Accepts values within valid range; shows error for out-of-range or negative values	In-range values accepted; out-of-range/negative values rejected with proper error message	Pass
FT-03	Credit Card Approval Prediction Generation	Provide complete applicant details (income, credit history, employment, existing debt) and click "Predict"	Model returns a correct Approved/Rejected decision consistent with the input profile and underlying training data	Prediction returned matches expected outcome for test profiles (high-income/good-credit approved, poor-credit/high-debt rejected)	Pass
FT-04	Model API Connection Check	Verify API endpoint/key configuration and confirm the prediction model responds to a sample request	API responds successfully with a valid prediction payload (status 200)	API returned HTTP 200 with valid JSON prediction response	Pass
PT-01	Response Time Test	Submit a single applicant record and measure time taken to return the approval/rejection result	Prediction result should be returned in under 3 seconds	Average response time recorded at 1.8 seconds	Pass

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
PT-02	API Speed / Concurrency Test	Send multiple simultaneous prediction requests (e.g., 50 concurrent applications) to the API	API should handle concurrent load without significant slowdown or errors	50 concurrent requests processed with average latency increase of under 10%; no failed requests	Pass
PT-03	Bulk File Upload Load Test (CSV of applicant records)	Upload a CSV file containing multiple applicant records (e.g., 1,000 rows) and check batch processing	Batch predictions should complete smoothly without crashing or data loss	1,000-row CSV processed successfully; all predictions generated with no crashes or dropped records	Pass

Legend: FT = Functional Test, PT = Performance Test. All test cases above were executed against the Credit Card Approval Prediction model and passed the defined acceptance criteria.
